About me

I am a motivated and adaptable student. I find myself particularly involved in working in teams and I am also willing to face challenges and contribute to impactful projects.

More information about me: [Portfolio Site](#)

Education

2017 - 2021

SSOU "Kole Nedelkovski"
Veles

**Electrical Engineer for Computer
Technology and Automation**

2021 - 2026

Faculty of Information
Sciences and
Computer Engineering

**Bachelor of Science in Software
Engineering and Information
Technologies**

Projects

ISP architecture simulation and Cloud Networking

multi-layer network connecting regional centers via **OSPF (Multi-area)** routing. The project includes advanced traffic segmentation with **VLANs**, implementation of Inter-VLAN routing and redundancy via STP protocol. Key network services (**DHCP, DNS, HTTPS, NAT**) and strict security policies via **ACL (Access Control Lists)** and **Firewall** configurations are set up. The system is optimized for IoT integration and Cloud availability, with detailed troubleshooting across all layers of the OSI model.

[ISP-Architecture](#)

Hotel App Devops

A containerized hotel management system built with Django and PostgreSQL for booking. Using Docker, the app and database run in separate containers with persistent storage and environment-based configuration, while Docker Compose orchestrates local service dependencies and automated setup. The project also integrates Kubernetes for scalable deployment.

PrognozaDuvaLi?

weather forecasting web app built with React and Java Spring Boot. It provides real-time weather data, forecasts, and location-based insights through a sleek, responsive, and user-friendly interface. The app is hosted on Render for the backend, and Vercel for the frontend.

Linux Sysadmin Automation and Implementation

Developed and deployed a custom automation suite on a headless Ubuntu Server environment to manage log hygiene and secure administrative access. The project focused on reducing manual overhead and minimizing the attack surface of the server.

Exploring Windows Server

Demonstrates the deployment and administration of a Windows Server Active Directory environment within a simulated enterprise network (thm.local) For the simulation to be fully immersive, it was used AWS T3 VM from the page tryhackme.com. Every steps and actions are explained in Functionality.md

X-Men Fandom

Fan-made X-Men Fandom project built with Java Spring Boot (backend) and React (frontend). It allows you to explore a collection of heroes, villains, and teams, view their details, and display random characters on the home page.
